                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC transfers a fucose moiety to galactosyl-beta-1-4-N-acetylglucosamine (C (generating the Lewis x or y epitope). It does not transfer a fucose content to alpha-2,3-sialyl-galactosyl-beta-1-4-N-acetylglucosamine and therefore does not generate the sialyl-Lewis x epitope. The invention (C also relates to DNA sequences encoding alpha-1,3- fucosyltransferase and c expression vectors and host cells comprising these DNA sequences. The c (invention additionally encompasses the preparation of alpha-1,3- fucosyltransferase via the culture of transformed cells or by expression cof the protein in a transgenic animal, antibodies which recognise alpha-1,3-fucosyltransferase, methods for screening potential inhibitors or preparation of compounds having fucose-containing sugar chains by use of the protein; and knockout non-human animals lacking alpha-1,3- fucosyltransferase has a similar substrate crange to the known fUC-TIV and is expressed mainly in brain and kidney c tissues. Alpha-1,3-fucosyltransferase may be used for the treatment and cidiagnosis of diseases of the brain and kidney, and of cancers. They may be used for the identification of substances which affect the activity or expression of alpha-1,3-fucosyltransferase; such substances may be used to the activity or expression of alpha-1,3-fucosyltransferase; such substances may be used to study the mechanisms of action and expression of alpha-1,3-fucosyltransferase. They may be used to study the mechanisms of action and expression of alpha-1,3-fucosyltransferase. The present of action and expression of alpha-1,3-fucosyltransferase. The present content is a sequence represents human alpha-1,3-fucosyltransferase. The present content is a sequence represents human alpha-1,3-fucosyltransferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01676-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57377-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid genes from Drosophila and interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; SEQ ID NO 15042; 21pp + Sequence Listing; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Š
                                                  CC transfers a fucose moiety to galactosyl-beta-1-4-N-acetylglucosamine moiety to galactosyl-beta-1-4-N-acetylglucosamine complete to alpha-2,3-sialyl-galactosyl-beta-1-4-N-acetylglucosamine and therefore does not generate the sialyl-Lewis x epitope. The invention complete the sialyl-Lewis x epitope. The invention complete to DNA sequences encoding alpha-1,3-fucosyltransferase and compression vectors and host cells comprising these DNA sequences. The invention complete the propagases the preparation of alpha-1,3-fucosyltransferase via the culture of transformed cells or by expression complete the protein in a transgenic animal, antibodies which recognise alpha-1,3-fucosyltransferase, methods for screening potential inhibitors or compounds having fucose-containing sugar chains by use of the protein, and knockout non-human animals lacking alpha-1,3-fucosyltransferase has a similar substrate fucosyltransferase. Alpha-1,3-fucosyltransferase has a similar substrate fucosyltransferase, nucleorides which encode it, antibodies, potentiators and inhibitors may be used for the treatment and diagnosis of diseases of the brain and kidney, and of cancers. They may complete the activity or expression of alpha-1,3-fucosyltransferase, such substances may be used to study the mechanisms of action and expression of alpha-1,3-fucosyltransferase. The present may be used to study the mechanisms of action and expression of alpha-1,3-fucosyltransferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Alpha 1,3-fucosyltransferase generating Lewis epitope and an antibody recognizing it useful kidney disease and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Alpha-1,3-fucosyltransferase; fucose; glycosylation; Lewis epitope; brain; kidney; recombinant expression; transgenic animal; knockout animal; FUC-TIV; drug screening; inhibitor; potentiator; diagnosis; treatment; cancer; murine; mouse.

                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the isolation of novel human enzyme copypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences concoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, concomprise the concoding them. The sequences of the invention are useful in the consortion transferases, transferases, hydrolases, lyases, concording the invention are useful in the concoding transferases of a wide range of consortion in the consortion are useful in the consortion in the consortion are useful in the consortion in the consortion are useful in the consortion in the consortion and/or prognosis of a wide range of consortion in the consortion in the consortion in the consortion and loss orders (e.g. AIDS) autoimmune disorders (e.g. cancer), consortion consortion (e.g. AIDS) autoimmune disorders (e.g. cancer), consortion consortion (e.g. atherosclerosis), blood-related disorders (e.g. atherosclerosis), blood-related disorders (e.g. atherosclerosis), blood-related disorders (e.g. influenza). The polynucleotides of the convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy. AAUZ2915-AAUZ3814 represent convention can also be used in gene therapy.
                                                                                                                                                                                                                                                                                                          Query Match

                                 Claim
The invention describes an isolated nucleic acid molecule comprising a sequence encoding musculoskeletal system associated polypeptides useful for detecting disorders, e.g., cancer or cancer metastases, in animals
                                                Isolated nucleic acid molecules associated polypeptides, useful
                                                                                                                   (ROSE/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03097-ABB04109) associated with the musculoskeletal system useful for CC preventing, treating or ameliarating medical conditions e.g. by protein CC or gene therapy. The genes are isolated from a range of human tissues CC disclosed in the specification. The nucleic acids, proteins, antibodies CC and (ant)agonists are useful in the diagnosis, treatment and prevention CC of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the CC adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, CC lung, or urogenital; (b) immune disorders e.g. Addison's disease, CC allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, CC arthritis and ulcerative collitis, (c) cardiovascular disorders such as CC exeberal anoxia and epilepsy, and (f) infectious diseases such as viral, correctial, fungal and parasitic infections. Note: The sequence data for CC cotained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a new receptor and membrane-associated CC protein (REMAP). The polypeptide, polynucleotide and agonist are useful CC for treating a condition associated with decreased expression of CC functional REMAP. The antagonist is useful for treating a disease CC associated with overexpression of functional REMAP. The antagonist is useful for treating a disease associated with overexpression of functional REMAP. The antagonist is the expression of REMAP. These polypeptides, polynucleotides, agonists are particularly useful for diagnosing, treating or preventing cardiovascular (e.g. atherosclerosis, hypertension, aneurysms, CC congestive heart failure, angina pectoris, or ischaemic or rheumatic complysema or bronchitis) gastrointestinal (e.g. nausea, peptic ulcer or CC crohn's disease), lipid metabolism (e.g. Fabry's disease, diabetes CC mellitus or hyperlipidaemia), autoimmune/inflammatory (e.g. anaemia, CC asthma, gout, pancreatitis or Crohn's disease, neurological (e.g. CC dementia, stroke, Alzheimer's disease, Creutzfeldt-Jakob disease, CC multiple sclerosis, parkinson's disease, anxiety, schizophrenia or CC cushing's syndrome), endocrine or cell prollierative disorders (e.g. CC cushing's syndrome), endocrine or cell prollierative disorders (e.g. CC cancers including adenocarcinoma, leukaemia, lymphoma or REMAP CC sarcoma). The present amino acid sequence represents a human REMAP cc protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

New isolated nucleic acid genes from Drosophila and interactions. detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell

Disclosure; SEQ ID NO 8727; 21pp + Sequence Listing; English.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher sukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences The invention signalling and 2.

cc immunosuppressive, antichtyroid, antilatentic, distributory, discributory, distributory, distributory, distributory, distributory, dermatological, antidiarrheic, vulnerary, haemostatic, virucide, cc dermatological, antidiarrheic, vulnerary, haemostatic, virucide, cc antiboaterial, nootropic, neuroprotective, antiparkinsonian, cc anticonvulsant, analgesic, anorectic, metabolic and immunomodulator cativity. (I) and (II) are useful for treating proliferative and/or cd differentiative disorders of the colon, including adenoma and colorectal carcinogenesis, the liver, including nodular hyperplasia and adenomas, compared to including pepthelial hyperplasia and sclerosing adenomas, compared to including bronchogenic carcinoma and neuroendocrine tumour. The considerative disorders treated also include haematopoietic neeplastic disorders such as acute promyeloid leukaemia, acute myelogenous cleukaemia. (I) and (II) are also useful for treating cardiovascular consenses, disorders of blood vessels, immunological disorders such as color diseases, disorders of color disorders, disorders, disorders, disorders of liver such as disorders color disorders, disorders of liver such as disorders of newstasis, disorders of fibrous tissue, hepatocellular necrosis compostasis, disorders of parain such as intracranial haemorrhage, compostasis, disorders of parain such as intracranial haemorrhage, compositated with accumulation of fibrous as intracranial haemorrhage, accumulation of pain disorders. (I) can be used in gene contributory such as intracranial haemorrhage.

New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

ID NO 3043; 1185pp; English.

The invention relates to 971 novel human cDNA sequences (ADC29919-CC invention also relates to nucleic acid sequences (PAC29919-CC invention also relates to nucleic acid sequences over 99t identical with CC the novel human cDNAs. The invention additionally encompasses expression CC vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an antibody CC against a polypeptide of the invention; an antibody CC ambiful antibodies of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The CC invention further discloses methods of peventing, treating or antibodies candor monoclonal antibodies for carrying out the methods of the contigs (ADC3161-ADC3161-ADC31627) and the polypucleotide and/or polypeptide; and of (ADC31861-ADC31627) and the polypucleotide and/or polypeptide; and the contigs sequences corresponding to the cDNA sequences of the invention of (ADC31861-ADC31627) and the polypeptides encoded by the contigs (ADC32628 case) in diagnostics, drug screening, forensics, gene mapping, in the CC disease and other neurodegenerative and polypeptides of the invention are companied to the retaing diseases such as Barkinson's disease. Alzheimer's CC disease and other neurodegenerative diseases, anaemia, platelet cancer. The nucleic acids may also be used as hybridisation probes or cancer. The nucleic acids may also be used as hybridisation probes or cancer also useful in generating antibodies, as molecular weight markers, cancer also seful in propertide sequence used in an example of the invention. Note: The sequence data for this patent did not form part of the printed cat after this patent did not form part of the printed cat after this patent did not format directly from MPO

Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and disorders related to organ transplantation.

2508pp; English.

Sequences ABP31028-ABP35561 represent 4534 novel human proteins CC designated ORF (open reading frame) 1-4534, and sequences ABN7504-CC ABN75987 represent cDNAs encoding them: The invention also encompasses CC polypeptides at least 80% identical to the ORF1-ORF4534 (collectively CC referred to as ORFX) proteins, polynuclectides at least 85% identical to the ORF1-ORF4534 (collectively CC referred to as ORFX) proteins, polynuclectides at least 85% identical to the ORFX encompasses of the ORFX uncleic acid sequences, vectors and host cells comprising ORFX polynuclectides, the recombinant production of ORFX proteins, antibodies of specific for ORFX proteins, methods of detecting ORFX polynuclectides and polypuppides, methods of screening for modulators of ORFX expression or comprising or modulators of ORFX expression or comparation, and methods of screening for modulators of ORFX expression or comparation, industry and as cytokine, cell proliferation, cell differentiation, immune modulation, haematopoiesis regulation, cell proliferation, cell differentiation, immune modulation, haematopoiesis regulation, cell proliferation, cell pro

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

CT The invention relates to full length GENSET human nucleic acids encoding potentially secreted proteins. The nucleic acids and the polypeptides ct they encode may be used in the prevention, treatment and diagnosis of the year code with inappropriate GENSET gene expression. For cc example, they be used to treat disorders associated with decreased GENSET cc gene expression by rectifying mutations or deletions in a patient's gene expression by rectifying mutations or deletions in a patient's cc genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense cc patients own production of GENSET polypeptides. Conversely, antisense cc patients own production of GENSET polypeptides. Conversely, antisense cc expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be used as DNA cc probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy. The GENSET polypeptides condentify modulators (agonists and antagonists) of GENSET polypeptide of the production and activity. The present sequence is a GENSET polypeptide of the production and activity. The present sequence is a GENSET polypeptide of the production and activity. The present sequence is a GENSET polypeptide of the production of antipolicies and in assays to determine who is a GENSET polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Full length GENSET human nucleic acids encoding potentially secreted proteins, useful in gene therapy and vaccination against a variety of diseases, and for diagnosis of those diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 21; Page 819-820;

Claim 4; Fig 1; 184pp; English.

CC fucosyl transferase, seven transmembrane receptor, or Rho GTPaseCC activating protein (RhoGAP) family members. The DNA and protein sequences
CC of the invention are useful for identifying a compound capable of
CC treating a disorder by aberrant expression of the mucleic acid or the
CC activity of the protein, in evaluating the efficacy of treatments and in
CC diagnosis. The invention also comprises a method for tracating a disorder
CC treating breast, ovarian, prostate, colon, or lung cancer, heart,
CC cardiovascular (including endothelial cell), haematopoieteic, blood
CC wessel and brain disorders. It is also useful in treating pain and
CC metabolic disorders, liver disorders and platelet disorders. The DNA and
CC protein sequences are also useful in treating pain and
CC e.g. acute leukaemia), cardiovascular disorders (e.g. cardiac
CC hypertrophy, myocardial infarction, rheumatic fever), endothelial cell
CC diesorders (e.g. psoriasis, Grave's disease, rheumatoid arthritis),
CC degenerative disorders (e.g. diabetes mellitus, multiple sclerosis,
CC crohn's disease, asthma), blood vessel disorders (e.g. Kaposi sarcoma),
CC degenerative disorders (e.g. Alabeimer disease), and hormonal disorders.
CC The sequences of the invention are also useful as query sequences to
CC dientify other family members or related sequences. The present sequence
CC represents the human 80090 protein of the invention polynucleotides 80090, to the DNA and protein sequences of novel isolated 52874, 52880, 63497, or 33425 encoding novel

New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

SEQ ID NO 1360; 1185pp; English

The invention relates to 971 novel human cDNA sequences (ADC29919-CC ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The clivention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression expression of a polypeptide of the invention; the invention; and methods of the invention; and methods of against a polypeptide of the invention; and methods of clientifying a compound which binds to a polypeptide of the invention. The clientifying a compound which binds to a polypeptide of the invention. The clientifying a methods of peventing, treating or cameliorating a methods of peventing, treating or cameliorating a methods of peventing, treating or cand/or monoclonal antibodies for carrying out the methods of the conversion or activity of the polymucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the clientification of mutations responsible for genetic disorders or other types of data and products dependent on DNA and amino acid sequences. They are confidenced and for treating diseases such as Barkinson's disease, Alzheimer's diseases and other tration.
